

# ROLL AN ARRAY

Roll two dice. Draw the multiplication fact anywhere on the grid and write the product in it (like if you roll a 5 and a 2, color in 5 rows of 2 going across or down and write 10 in that area). See how close you can get to filling in every square. If two players play, you can each color your squares in a different color. If your answer doesn't fit in the squares remaining, it goes to the next person. Who can color in the most squares?
